IN THE SPECIFICATION:

The specification as amended below with replacement paragraphs shows added text with <u>underlining</u> and deleted text with <u>strikethrough</u>.

Please REPLACE Abstract with the following Abstract:

An EGR system (1) for an internal combustion engine E-provided with a first EGR passage (10) for recirculating EGR gas to the downstream side of a compressor from the upstream side of a turbine (2a) of a turbo-charger (2) is provided with a second EGR passage (20) for recirculating EGR gas from the downstream side of the turbine (2a) to the upstream side of the EGR gas, and provided also with a DPF (21) in the second EGR passage (20), while the exhaust gas flow in the first EGR passage (10) and the second EGR passage (20) is controlled based on the exhaust gas temperature detected by an exhaust gas temperature sensor (32) arranged in the exhaust gas passage-(3).

Thus, NOx can effectively be reduced by performing EGR while securing a high EGR rate even at a high load.
